CSE 403 ACalendar Week 10 Report
11/29/16

- Goals from last week
  - Now that the bulk of the logic of ACalendar has been established and implemented, we will start focusing on error handling and improving user experience. This also includes refining the UI.
  - For our feature-complete release, we didn't have enough time to get the "event history messages" feature out. Therefore, this week, Qinrong Lin will keep working on this.
  - If everything goes smoothly, we would also like to start testing our app more thoroughly. This includes more backend unit testing, more integration/system/performance testing, etc.

- Progress we've made this week
  (Last week was Thanksgiving, so we didn't get too much done last week...)
  - We started refining the UI for our app. We are trying to give it a consistent navy blue minimalistic theme.
  - We decided to add two extra email-related functionalities (described in the section below).
  - Qinrong Lin has been working on the event history messages feature.
  - We started preparing for the release candidate.

- Plans & goals for next week
  - We'll continue working on refining the UI of our app.
  - We will add two extra functionalities:
    - We will send out email notifications when user A wants to add user B as a friend.
    - We will also send out email notifications when a user shares an event with other users.
  - Qinrong Lin will continue working on the event messages history feature and we plan to get this out by this coming Friday.
  - We will modify all the documents we wrote before (for users & developers).
  - We will conduct user testing as described in the release candidate website.
